

An aerial photograph of the Hoover Dam and its power plant. The dam is a massive concrete structure with a curved crest, situated in a deep canyon. The water behind the dam is a deep blue. Several spillways are visible, with water cascading down. The power plant is a long, rectangular building with a flat roof, located at the base of the dam. The surrounding landscape is rugged and rocky, with some sparse vegetation. The sky is clear and blue.

Post-Obstructive Diuresis

By Marshall Marcus

Causes of Urinary Tract Obstruction

TABLE 283-1 COMMON MECHANICAL CAUSES OF URINARY TRACT OBSTRUCTION

Ureter	Bladder Outlet	Urethra
Congenital		
Ureteropelvic junction narrowing or obstruction	Bladder neck obstruction	Posterior urethral valves
Ureterovesical junction narrowing or obstruction and reflux	Ureterocele	Anterior urethral valves
Ureterocele		Stricture
Retrocaval ureter		Meatal stenosis
		Phimosis
Acquired Intrinsic Defects		
Calculi	Benign prostatic hyperplasia	Stricture
Inflammation	Cancer of prostate	Tumor
Infection	Cancer of bladder	Calculi
Trauma	Calculi	Trauma
Sloughed papillae	Diabetic neuropathy	Phimosis
Tumor	Spinal cord disease	
Blood clots	Anticholinergic drugs and	
Uric acid crystals	α -adrenergic antagonists	
Acquired Extrinsic Defects		
Pregnant uterus	Carcinoma of cervix, colon	Trauma
Retroperitoneal fibrosis	Trauma	
Aortic aneurysm		
Uterine leiomyomata		
Carcinoma of uterus, prostate, bladder, colon, rectum		
Lymphoma		
Pelvic inflammatory disease, endometriosis		
Accidental surgical ligation		

Bilateral Ureteral Obstruction – Pathophysiology

TABLE 283-2 PATHOPHYSIOLOGY OF BILATERAL URETERAL OBSTRUCTION

Hemodynamic Effects	Tubule Effects	Clinical Features
Acute		
<ul style="list-style-type: none"> ↑Renal blood flow ↓GFR ↓Medullary blood flow ↑Vasodilator prostaglandins 	<ul style="list-style-type: none"> ↑Ureteral and tubule pressures ↑Reabsorption of Na⁺, urea, water 	<ul style="list-style-type: none"> Pain (capsule distention) Azotemia Oliguria or anuria
Chronic		
<ul style="list-style-type: none"> ↓Renal blood flow ↓↓GFR ↑Vasoconstrictor prostaglandins ↑Renin-angiotensin production 	<ul style="list-style-type: none"> ↓Medullary osmolarity ↓Concentrating ability Structural damage; parenchymal atrophy ↓Transport functions for Na⁺, K⁺, H⁺ 	<ul style="list-style-type: none"> Azotemia Hypertension ADH-insensitive polyuria Natriuresis Hyperkalemic, hyperchloremic acidosis
Release of Obstruction		
<ul style="list-style-type: none"> Slow ↑ in GFR (variable) 	<ul style="list-style-type: none"> ↓Tubule pressure ↑Solute load per nephron (urea, NaCl) Natriuretic factors present 	<ul style="list-style-type: none"> Postobstructive diuresis Potential for volume depletion and electrolyte imbalance due to losses of Na⁺, K⁺, PO₄²⁻, Mg²⁺, and water

Note: GFR, glomerular filtration rate.

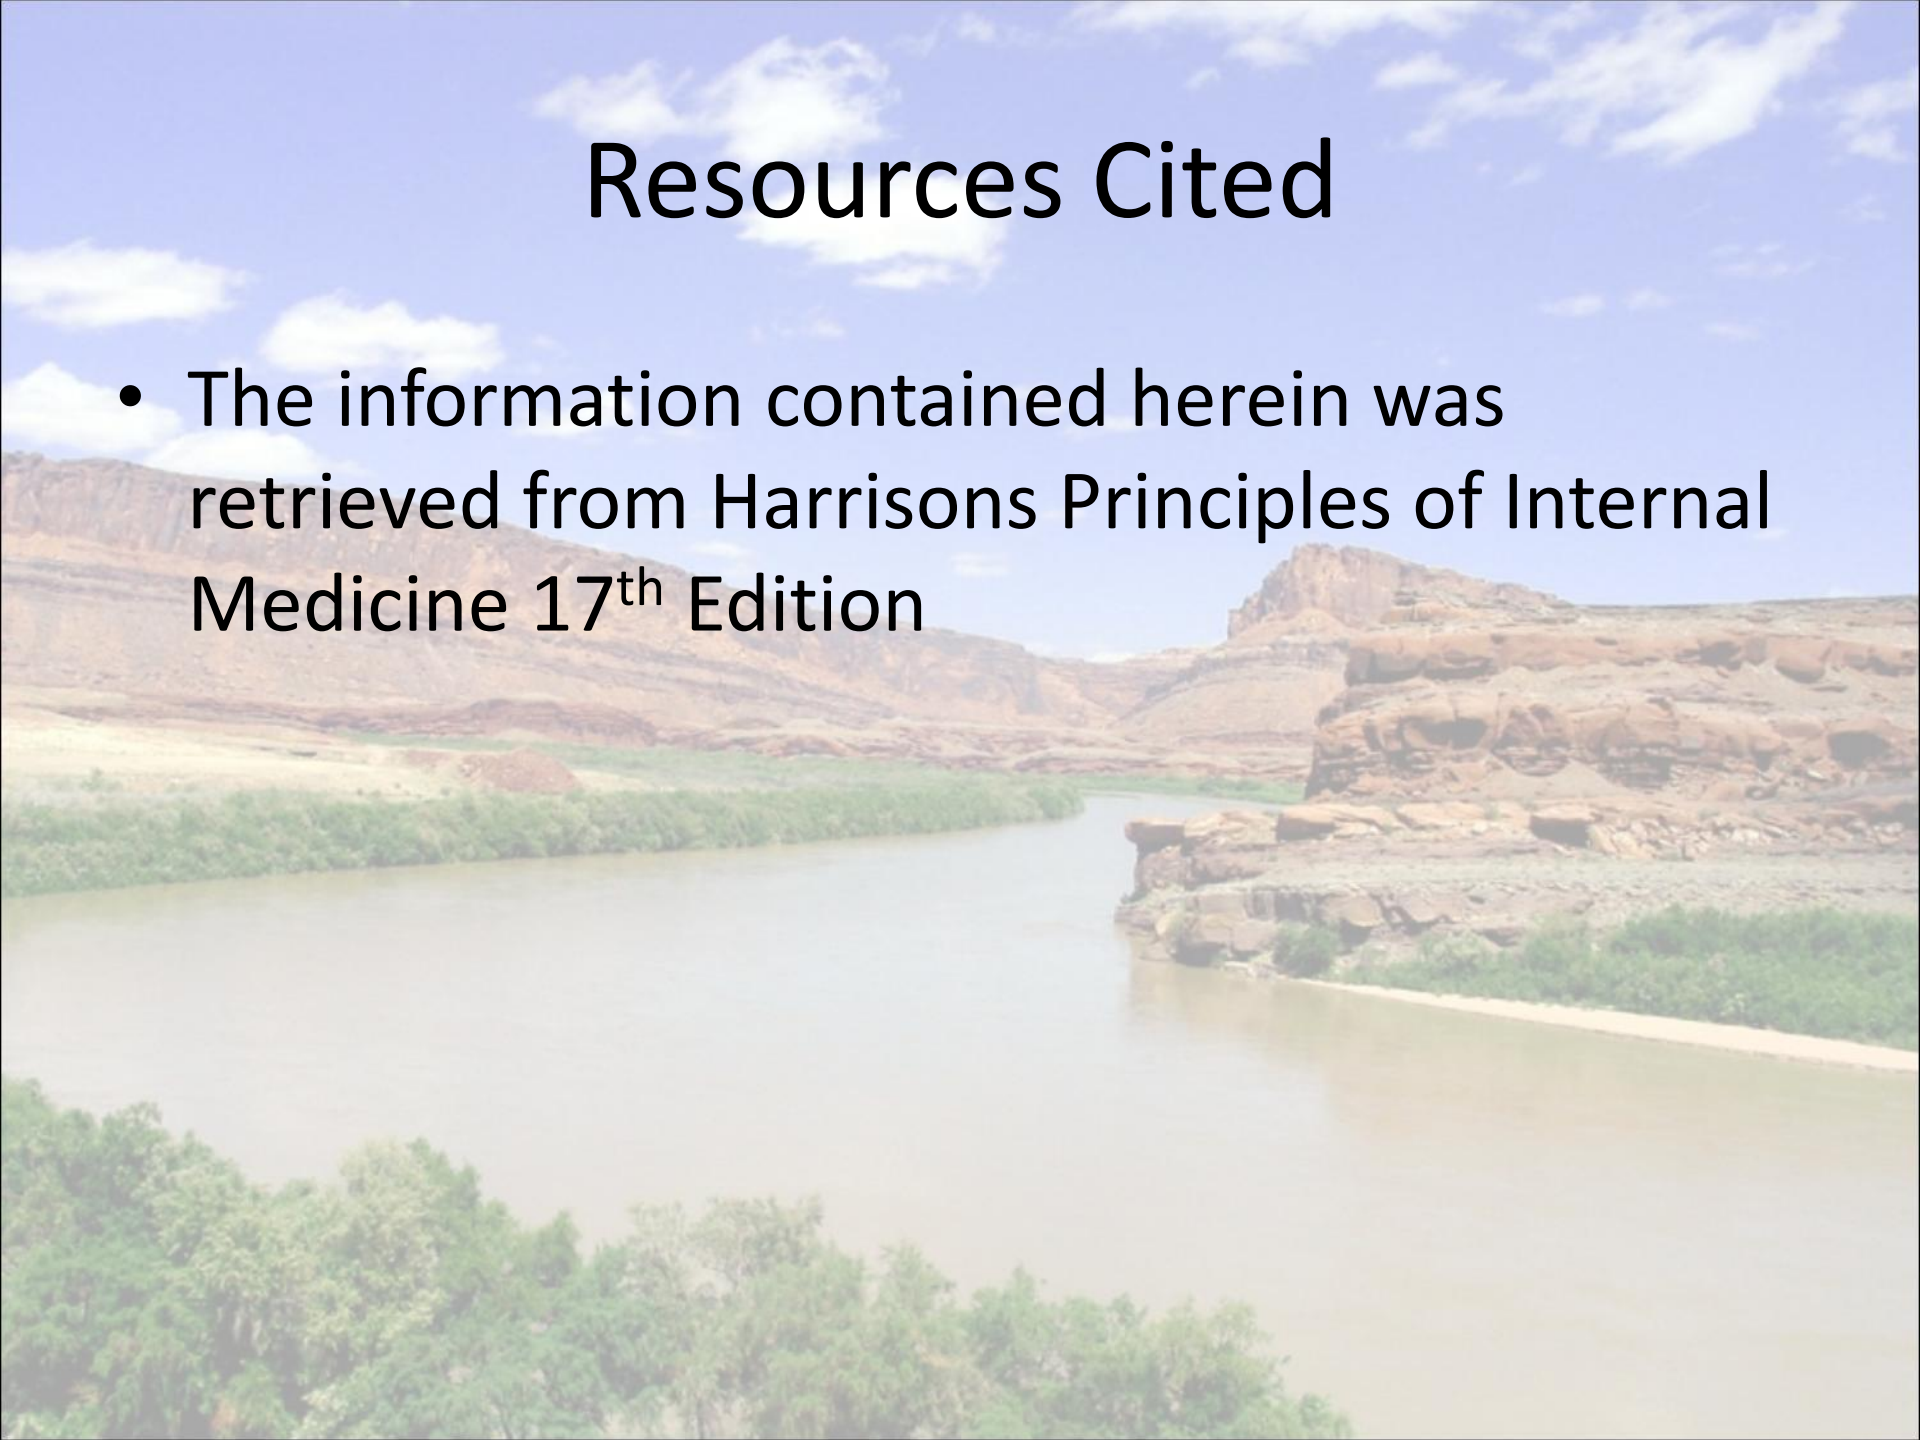

Post-Obstructive Diuresis – Key Points

- **Post Obstructive Diuresis is a condition of bilateral obstruction**
- **Usually the Diuresis is APPROPRIATE**
- **Only replace urinary losses in the setting of...**
 - Hypovolemia
 - Hypotension
 - Electrolyte disturbances
- **Replacing $\leq 2/3$ (urinary loss/day) with .45% saline is usually effective**
- **Rarely, patients may need salt containing solutions to replace Na^+ and volume deficits**
